SUMMARY

Software Engineer (5+ years) with experience in building AI agent tooling and developer platforms. Built and containerised the AI Agentic Gateway (LangGraph), currently deployed for internal stakeholders; a standalone Jenkins MCP server that gives agents tool access to CI, and a shared library of AI agent skills and guardrails validated with an evaluation harness. Also built Local-CI and a human-in-the-loop agent that fixes build errors in CI pipelines. **Focus:** agent execution, tool integration, evals to improve developer experience.

WORK EXPERIENCE

Software Engineer, InterSystems — 07/2023 - Present

- Built and containerised the pre-release AI Agentic Gateway (FastAPI/LangGraph) and deployed it internally for about 100 engineers as a multi-arch (amd64/arm64) UBI9 Docker image, as a service on Windows & Linux, hardened build scripts for continuous integration, and pipelines for continuous deployment.
- Built a standalone Jenkins MCP server that gives AI agents tool access to CI, supporting Jenkins versions older than 2.533.
- Authored a shared library of AI agent skills and coding/test guardrails that made routine release and engineering work self-service, validated with an offline evaluation harness.
- Built a human-in-the-loop agent, delivered as the Adhoc browser extension with approval gates and AI-assisted runbooks, that diagnoses and fixes build errors in Adhoc pipelines, saving 1 to 2 hours per week.
- Built Local-CI, a self-service tool used by tens of engineers that reproduces the shared Jenkins compile and unit-test pipeline on developer machines (Windows/WSL, macOS, Apple Silicon), matching CI results, fixing environment drift, and saving several hours per change.
- Built an orchestrator that runs EHR dev containers with browser-based VS Code for AI-ready development.
- Refactoring the EHR container from a single layer into 3 Kubernetes pods - compute, web, and data - as the execution substrate for containerised workloads.

Intern, Building Blockchain Engineer, Autodesk — 05/2022 - 08/2022

- Improved data transparency by developing a consistent, immutable audit-logging mechanism using Hyperledger Fabric-based private blockchain network via AWS Managed Blockchain.
- Developed Smart Contracts in Go Lang and designed an API mechanism to enable secure querying and addition of records to the blockchain ledger, with identity-based access to certified data.
- Utilized Terraform to launch AWS resources and Docker to simulate the Hyperledger network on a single EC2 instance, creating a service to migrate event data to the blockchain network.

Software Developer, FinIQ — 06/2019 - 04/2021

- Developed and maintained web-based applications and WCF services for FX-Cash Setup and real-time FX-Trade Aggregation modules, resulting in a 10% faster trade aggregation process.
- Improved user experience and response times by migrating legacy application screens to (.NET) Dot-Net-based web applications based on user requirements.
- Designed and built a Hyperledger Fabric Blockchain-based decentralized Airbnb web application, securing first place in FinIQ's Blockchain Competition.

SKILLS

AI / Agents: LangGraph, FastAPI, MCP servers, Agent Skills, Tools and guardrails, Evals
Languages: Python, JavaScript, Bash, PowerShell, Java, SQL, TypeScript
Platform / CI: Jenkins, Docker, Ansible, CI/CD, Perforce, Git, OpenTelemetry, Kubernetes, Terraform
Data / OS: InterSystems IRIS, MongoDB, PostgreSQL, Red Hat Linux 8/9

EDUCATION

New York University MS Computer Science | GPA: 3.89 — **May 2023**

University of Pune BE Computer Engineering | GPA: 8.66 — **June 2019**
